121. Best Time to Buy and Sell Stock

[7, 1, 5, 3, 6, 4]

Start a pointer on both sides and make the L ptr value is less than the right pointer value

then start removing the right pointer but keeping the max value & difference

[7, 4, 5, 3, 6, 1]

edge case
my idea wouldn't work here between 5 and 6

Neetcode solution

Set the two pointers to the left

[7, 4, 5, 3, 6, 1]

update the L & R
if L -
and update the R if and keep max.
