Array / String

88. Merge Sorted Array

num1 = [1, 2, 3, 0, 0, 0] num2 = [2, 5, 6]

for this problem just compare each value in num1 & num2 using a ptr. if the value in num2 is < then replace the index that num1 is at and move the current value over 1.

```
ptr 1 = 0
ptr 2 = 0

while (ptr 1 < nums.len):

    if num2[ptr 2] < nums1[ptr 1]:

        I'm confused on the syntax
        here
```

my solution:

Time complexity of O(n) because we are going linear

Space complexity of O(1) no extra space is being created

Neetcode way!

1	2	3	0	0	0

2	5	6

Set the pointers at the last real number

when nums2 is empty you stop when you reach the algorithm

and add to the 0's which one is bigger

edge case

2, ...

when we iterate through all nums1 just all nums1 begin with left over elements.
