169. Majority Element

[2, 2, 1, 1, 1, 2, 2]

for this we can use more wrong algorithm

Most people would sort it then use a counter to store the largest number

neetcode solution

we could have used a hashmap but the space complexity would be O(n)

[2, 2, 1, 1, 1, 2, 2]

R = 2

C = 1 1 1 0 ← when the count becomes 0 then switch the number because we wanted a number that is more

(this algorithm only works if we assume there is a majority number)
